## RELAX(ed selection test)

## results summary

**INPUT DATA** 

AlphaDeltaSpike.fas

133 sequences

**1273** sites

Test for selection intensification (K = 1.31) was not significant (p = 0.558, LR = 0.34).

See here for more information about this method.

Please cite PMID 123456789 if you use this result in a publication, presentation, or other scientific work.

## Which sites are evolving differentially?

- We have established that in the HIV example, donor, recipient, and transmission branches evolve differently.
- Can we identify specific sites where this may be occurring?
  - Why is this of interest?
- More generally, given a tree with N sets of branches, we fish to find sites where evolution is different between these N sets, with a degree of statistical significance.

- Solution: use a fixed effects method (Contrast-FEL)
  - For each branch set i, estimate a dN/dS ration (N total ratios)
  - Test whether or not any of the ratios are different (group test)
  - For each pair of ratios, test if they are different [ up to N (N-1) / 2 tests ]
- Can identify subtle differences among selective pressures.
