Nei-Gojobori dN/dS estimate (NG86)

- For each codon C we define ES(C) and EN(C) the numbers of synonymous and nonsynonymous sites of a codon
 - e.g., ES(GAA) = 1/3, EN(GAA) = 8/3.
- May also define them as fractions of substitutions that do not lead to stop codons,
 - e.g., ES(GAA) = 1/3, EN(GAA) = 7/3.
- The sum of **ES** and **EN** over all codons in a sequence gives an estimate of expected synonymous and non-synonymous **sites** in a sequence.
- For two sequences (the target of the original method), we average **ES(C)** and **EN(C)** at each site.
- EN/ES is thus the expected ratio of non-synonymous to synonymous substitutions
 counts under neutral evolution

Simple methods for estimating the numbers of synonymous and nonsynonymous nucleotide substitutions

NG86 example

| | Site 1 | Site 2 | Site 3 | Site 4 | Site 5 | Site 6 |
|--------|------------|------------|------------|------------|------------|------------|
| Seq1 | <u>ACA</u> | <u>ATA</u> | <u>ATC</u> | <u>TTT</u> | <u>AAT</u> | <u>CAA</u> |
| Syn | 1 | 2/3 | 2/3 | 1/3 | 1/3 | 1/3 |
| NonSyn | 2 | 7/3 | 7/3 | 8/3 | 8/3 | 7/3 |
| Seq2 | <u>ACA</u> | <u>ATA</u> | <u>ACC</u> | <u>TTT</u> | AAC | CAA |
| Syn | 1 | 2/3 | 1 | 1/3 | 1/3 | 1/3 |
| NonSyn | 2 | 7/3 | 2 | 8/3 | 8/3 | 7/3 |
| Syn | 1 | 2/3 | 5/6 | 1/3 | 1/3 | 1/3 |
| NonSyn | 2 | 7/3 | 13/6 | 8/3 | 8/3 | 7/3 |

Mean

ES = $3\frac{1}{2}$, EN = $14\frac{1}{6}$: under neutrality, we <u>expect</u> the ratio of non-synonymous to synonymous substitutions of EN/ES ~ 4.05
